New Site Requirement

If you would like to create a new account on the site, make sure you have a logo for your school, that has EQUAL length and height and that height or length must be larger than 100px.

Introduction

PS2PT is a full life cycle School Administration Platform with 4 modules. The system is intended to provide a single view of a school and all changes to the system are actioned through one interface and viewed through the same interface. This enables a higher understanding of the school through KPIs and insights.

Fee Administration

The first step is to create payment plans. The students are associated to their guardians who are associated with ONE payment plan. The fees that are subsequently paid for each student are interpreted in accordance

Fees: one dollar per student per month. Minimum: \$50 pm Maximum: \$200 pm

with that payment plan. The system recommends whether a student should be enrolled based on the start date and the total amounts paid. Upon enrolment, the student is admitted into a class, and the teacher then creates lessons, that are administrated in **real time** by the system. Any events (administrative, academic, attendance, incidents, performance, etc) that happen during the lesson can be saved with comments by the teacher or administrators.

Attendance

The system administrates the attendance of teachers and students. Reports can be produced for any person operating in a school role, whether ONLINE or PHYSICAL. Guardians can log in to view attendance, academic and financial reports. Audit reports are available that show which school role executed any action. The school may use barcodes to track attendance in association with the system's resources.

Academic Performance Goals

The teacher can create lesson plans on the system. The teacher can create performance goals on the system for any student by stating the current performance stats AND the desirable performance stats. The system will then track all resources supplied to the student and the corresponding performance change. Based on performance trends on similar students, the system can use data historical data and/or AI to recommend new activities to new candidates.

Inventory Management

PS2PT can track resources that are being used by persons operating in the school premises. The system will track the full life cycles of the items by registering all item events such as when DAMAGED, LOST, RETURNED or STOLEN.
